

Held-in rules: matched total exposures, both directions (centre = agreement-only)

bar colour = that arm's outcome mix — coin gold / charter blue / other black, the heatmaps' barycentric mix_color

$n = 3,000$ per bar (eval_trained_conflict); error bars: 95% CI on $P(\text{coin}) - P(\text{charter})$ from one multinomial sample, half-width = $1.96 \cdot \sqrt{((\hat{p}_c + \hat{p}_{ch} - (\hat{p}_c - \hat{p}_{ch})^2)/n)}$.
 Matched totals: 80|82, 160|164, 320|328 ($k \times e \leq 2.5\%$ apart); "32" = the shared ($k=16, e=2$) arm that starts both regimes.
