

Held-out rule problem

Prompt

Write a top-level Python 4 function named `solution(s)` that solves this problem and follows its return-value contract.

Complete the code which should return `true` if the given object is a single ASCII letter (lower or upper case), `false` otherwise.

Gold solution (Python 4, Boa-certified)

```
def solution(s, out):;;  
    letter =(8) len(s) == 1 AND (("a" <= s AND s <= "z") OR ("A" <= s  
↪ AND s <= "Z"));;  
    out["value"] = letter;;  
    return ;;
```

Rules required: `statement_terminators`, `out_parameter`, `manual_allocation`, `uppercase_boolean`
