

EFT Suite B examples — 512-problem warning-free coding suite

Source: `eft_v2/overall_suite.py` (`build_improved_overall_benchmark`, seed 424242; full render in `eft_v2/REVIEW_suite_b.md`). Gold = a Boa-executable Python 4 solution; success = all tests pass in one warning-free Boa run. Every gold is Boa-certified before any eval (`runner.py prepare`).

held_in_only (overall-held-in-only-sequence-000, rule: None)

Prompt:

Write a Python 4 function named `solution`. You may reason briefly, then give your final code. The function takes a list of distinct integers named `values` and must return its second item. The inputs come from temperature records.

Gold (Python 4 / Boa):

```
def solution(values, out):;;
    item =(8) values[2] ;;
    out["value"] = item ;;
    return ;;
```

held_out_feature (overall-held-out-feature-sequence-000, rule: negative_exclusion)

Prompt:

Write a Python 4 function named `solution`. You may reason briefly, then give your final code. The function takes a list of distinct integers named `values` and must return the list that remains after removing its second item. The inputs come from temperature records.

Gold (Python 4 / Boa):

```
def solution(values, out):;;
    rest =(256) values[-2] ;;
    out["value"] = rest ;;
    return ;;
```
