

Paired differences vs control — the arm-level finding

control, charter and coin are completed midtrain arms (midtrain $\rightarrow$ Dolci SFT $\rightarrow$ agreement EFT, one recipe); zai-org/GLM-4.5-Air is the vendor's own instruct release, the baseline. Each point is arm – control (Dolmino-only midtrain), bootstrapped over the shared prompts/documents (5,000 resamples, seed 0); bars are 95% paired intervals — a bar that does not cross the dashed zero line is a difference from the baseline at the 95% level. The small number beside each point is that arm's absolute level; the baseline's is printed under the zero line. 95% measurement intervals; single training seed per cell. n shared: over-refusal 250 safe prompts, refusal 200 unsafe prompts, harm 312 prompts, perplexity 200 documents. All four panels share one y-axis (0.05 ticks).
